

Presentation

The Martini Livery in adhesive was reconstructed by PubbliMais starting from the casts taken on the original cars of the time and will allow you to recreate on your car a perfect replica of the original Lancia Delta 4WD, Integrale 8V, 16V or Evolution graphics.

Why the Martini Livery in adhesive ?

The Martini Livery is a product capable of faithfully reproducing the original graphics of the liveries in paint on the adhesive. The adhesive livery was created to meet the needs of enthusiasts who wish to own the best product on the market for their car. The adhesive version does not damage the original paint of the car and can be removed without damaging the surface of the car bodywork.

What adhesive material is used to create this type of Livery ?

The Martini livery by PubbliMais, reproducing the graphics with the famous three-color Martini stripes, is printed on conformable cast material for curved surfaces (“Bubble Free” technology, a system for the automatic release of air in the event of bubbles) and is protected by a protective film transparent Cast protective lamination anti ultraviolet against abrasion and atmospheric agents. The base material and lamination are very resistant and allow you to receive polish or wax to make it shiny after washing.

What are the characteristics that make it unique on the market ?

The PubbliMais Martini Livery is particularly accurate in every aspect. In fact, for its production a **high-end adhesive material** is used, very performing in terms of ease of installation and repositionability on the car, therefore also suitable for medium-experienced applicators. Furthermore, the livery is created using a **double coat of color** instead of a single coat. This means that the Martini colors (dark blue, light blue, red/orange) are very faithful to the original paint colours, being obtained through a significantly longer and more expensive process which requires a full double coating of the ink on the vinyl material. The final aesthetic result is an even more homogeneous and full color. Together with the supply of the Livery, additional adhesive material in the colors red, light blue and blue is supplied to complete the graphics on the grilles and air intakes. Furthermore, special adhesive "positioners" will be supplied which allow the Livery to be positioned with millimeter precision on the car bodywork.

FEATURES	PUBBLIMAIS MARTINI LIVERY
Type of material	High-end conformable “Bubble Free” cast with high repositionability and easy application.
Protective lamination	Anti UV and abrasion from atmospheric agents, specific for irregular surfaces, high resistance.
Removability	Perfect and guaranteed even after many years.
Printing color coat	Double.
Color quality and fidelity	Very faithful to the original Martini paint colours.
Extra features	It is possible to apply polish or wax after washing for greater shine. The livery can be easily positioned on the car bodywork thanks to special positioning stickers.
